# What You Need:

- R and RStudio
- Install Shiny and Dependencies through RStudio
- Account on [www.shinyapps.io](http://www.shinyapps.io)
- Github Account
- Drupal 7
- Entity API module
- Entity Iframe module

## Entity API

[View](#) [Version control](#) [Automated Testing](#)

Posted by [fago](#) on November 7, 2009 at 1:37pm

This module extends the entity API of Drupal core in order to provide a unified way to deal with entities and their properties. Additionally, it provides an entity CRUD controller, which helps simplifying the creation of new entity types.

### Requirements

- **Drupal 7.2** or later; suggested Drupal  $\geq 7.15$

### Documentation

You can find documentation in the [handbooks](#). Also check the [README](#) and the provided API docs in [entity.api.php](#).

## Entity iframe

[View](#) [Version control](#) [Automated Testing](#)

Posted by [btopro](#) on April 2, 2013 at 5:41pm

Entity iframe provides a simple way of creating and managing the embed-ability of content you are creating in a drupal site. It provides a path that displays an item in a different theme (optionally) which is more appropriate for visualizing in an iframe. There are several simple settings for modifying and controlling the output when viewing an entity as an iframe. This provides a consistent path for the rendering an entity in a way that's easy to be displayed in an iframe. An example of when you'd want to use this is when you have entities in a system that are objects for use in other systems (think youtube).

**this is inadequate**

# The Revised Concept

# Why?

- ✓ **Seamless R and JavaScript Integration**
- ✓ **The OpenCPU API is a clean and simple interface to R. It is compatible with any language or framework that speaks HTTP.**
- ✓ **Statistical Apps**
- ✓ **Concurrency by design**
- ✓ **Easy Installation, Configuration**

- ✓ **The cloud server builds on AppArmor to enforce security, and Nginx for caching and load balancing.**
- ✓ **All parts of OpenCPU are released under the Apache2 license.**

# OpenCPU App Demo

The sole purpose of this OpenCPU app is to demonstrate how to use the [opencpu.js](#) library to call R from Javascript using OpenCPU.

## Introduction

The opencpu.js library depends on jQuery and provides some convenient wrappers around \$.ajax to call the OpenCPU API. A copy of jquery and opencpu.js must be included with your OpenCPU app.

## Topics

Each topic consists of a minimal HTML page demonstrating basic functionality. Look at the source code of the HTML page to learn what is happening.

1. [Calling a function](#)
2. [Hello and AngularJS example](#)
3. [Making a plot](#)
4. [Include data in a package](#)
5. [Upload a file](#)
6. [Chaining functions \(use session\)](#)

# Download & Install

## Ubuntu 14.04 (recommended)

```
#requires ubuntu 14.04 (Trusty)
sudo add-apt-repository -y ppa:opencpu/opencpu-1.5
sudo apt-get update
sudo apt-get upgrade
```

Dual-boot Windows 7 and Ubuntu

```
#install opencpu server
sudo apt-get install -y opencpu
```

```
#optional
sudo apt-get install -y rstudio-server
```

## Fedora

Go [here](#) to add the opencpu repository. Also have look at the [readme](#) for rpm packages.

```
sudo yum install opencpu
```

## Debian / CentOS / Suse etc

See the [readme](#) on building [deb](#) or [rpm](#) packages from source.

## Docker

## Local Single-User Server

```
install.packages("opencpu")
library(opencpu)
```

## Installing OpenCPU Apps

```
#install the "gitstats" or "stocks" app from github
library(devtools)
install_github("opencpu/gitstats")
install_github("opencpu/stocks")
```

Recommended: appdemo

```
#open in single-user server
library(opencpu)
opencpu$browse("/library/gitstats/www")
```

## Server Manual PDF

The OpenCPU server manual PDF is the primary reference for installing and managing OpenCPU servers.

## OpenCPU APP: appdemo

The purpose of this OpenCPU app is to demonstrate how to use the [opencpu.js](https://github.com/ropensci/opencpu.js) library for calling R functions from Javascript using OpenCPU.

## Cloud Demo

Try the application online at the OpenCPU apps public demo server: <https://public.opencpu.org/apps.html>

## Use locally

To run the app in your local R session:

```
#install app
library(devtools)
install_github("appdemo", "opencpu")

#load in opencpu
library(opencpu)
opencpu$browse("/library/appdemo/www")
```

## What this module does

This module provides a bridge between Drupal and the [AngularJS](#) framework for creating rich, interactive web applications that rely on Drupal content. By default the module uses version 1.0.8 of AngularJS pulling the unminified code from the Google CDN. This may be

changed by going to the administrative page. If you want to download the files to host locally they can be found at <http://code.angularjs.org/> and placed in sites/all/libraries/angular.

## Dependencies

- [Libraries API](#)

## Installation

- Download and install the dependencies
- Enable angularjs module and angularjs\_examples module
- Go to /angular/nodes to see example interacting with Drupal

# angular-drupal

An Angular JS module for Drupal 7 Services.

## Intro

This Angular module makes it easy to `read/write` entity data `to/from` Drupal, handles user authentication and registration, and makes it easy to retrieve JSON data from Views.

Here's a very *simple* Angular app that loads `node # 123` from Drupal and then displays the node's title (via an `alert`):

```
// My simple app.
angular.module('myApp', ['angular-drupal']).run(['drupal', function(drupal) {

    drupal.node_load(123).then(function(node) {
        alert(node.title);
    });

}]);

// The angular-drupal configuration settings for my simple app.
angular.module('angular-drupal').config(function($provide) {

    $provide.value('drupalSettings', {
        sitePath: 'http://my-drupal-site.com',
        endpoint: 'api'
    });

});
```

# Current Status

# Next Steps . . .

- ❑ **Intensive training in AngularJS**
- ❑ **Complete the Ubuntu test server's environment so that I can integrate NodeJS into the architecture**
- ❑ **Replace Drupal 7 with Drupal 8 in the architecture**
- ❑ **Investigate DeployR as a potential substitute for OpenCPU (<http://deployr.revolutionanalytics.com/>)**

- ❑ **Determine if other applications can be integrated into the architecture (WordPress, Alfresco, Salesforce, and so on)**
